Rateon Privacy Policy

Last updated on January 11, 2026

This privacy policy applies to the Rateon Discord application (referred to as "bot" or "Service" hereafter) found as Rateon#7990. It explains how we use, store, protect, and share user data through use of our Service.

The bot provides various utilities for the game Geometry Dash directly in your Discord client. For example, it lets you look up Levels, Lists, Leaderboards, Gauntlets, Map Packs, and more. We store very little user data beyond what is publicly available through the game itself and its API. All Discord-specific data is designed to be opted into, and it can also be removed at any time with a simple command. Some Geometry Dash data may be cached for performance reasons; this is, however, completely independent of Discord user data, unless you choose to opt in. More information can be found below.

Data Storage

By default, all of the information displayed by the bot is retrieved dynamically from Geometry Dash, including any user profile statistics. Aside from statistics, public social links set on Geometry Dash profiles are also accessed, which can be removed in-game at any time. This data is not permanently stored but may be temporarily cached to improve performance. Cached data is automatically refreshed or discarded as

needed. For example, re-using the "/profile" command after changing or removing your social links in-game will instantly reflect in Discord.

To receive Geometry Dash notifications related to your account directly in a direct message on Discord, we have implemented a "/link" command. The Geometry Dash account that you want to link to has to be specified by username, and the Service checks whether this specific Geometry Dash account has entered your Discord username (the one attempting to link) in its social link settings before successfully linking the accounts. After completing the link, the following data is stored and linked in our Service:

- Your user ID. This is a unique identification number tied to your Discord account.
- Your Geometry Dash username.

As mentioned, even without linking, data related to your Geometry Dash account, including any of your Levels or Lists, may be accessed through the game's servers.

Data Access

The limited data we collect related to Discord, listed above, is used to:

- Verify the association between a Discord user and a Geometry Dash account.
- Send notifications associated with your linked Geometry Dash account in a direct message on Discord.

No data is shared outside of Discord nor sold to any third parties.

Data Storage Length

The limited data we collect, listed above, is stored as long as the Service functions or until data deletion is requested, as explained below.

Data Request & Deletion

Requesting your data, which only consists of your user ID and public Geometry Dash data, is not necessary. Checking your profile in the bot shows everything. To begin the limited data deletion, simply use "/unlink" to remove the link. This removes any trace of your user ID in our system. Note that you must also remove the Discord username in your Geometry Dash's social settings to remove all ties between Discord and Geometry Dash. To stop any further Geometry Dash data from showing in Discord, such as your Levels, Lists, or other profile statistics, you must remove or delete the data within Geometry Dash itself. We cannot remove any data from the game's servers for you.
